

Shift Production Incentive

Pacific Surfaces - Production: Silos > Mixer > Distributor/Kreos > Robo > Press > Oven > Jot

What this is

Every month each shift earns a **score**. The shift with the highest score earns the highest incentive, paid as a **percentage of your own salary** - everyone on the shift shares the same result, but each person's amount is based on their own pay.

Production is a team game. One person cannot win this alone, and one person cannot lose it alone. Silos, mixer, distributor, press, oven and Jot all count as one shift. You win together.

How the score is calculated

Your score is built from **two things only** - how much you made, and how good it was.

$$\text{SCORE} = \text{QUANTITY} \times \text{QUALITY}$$

They are **multiplied, not added**. This matters:

- 1,000 slabs made badly = low score
- 100 slabs made perfectly = low score
- **Many slabs made well = high score**

You cannot make up bad quality by producing more, and you cannot make up low production by being careful with a few slabs. **You need both.**

1. QUANTITY - how many slabs

The number of slabs your shift produced that reached **Jot** and were measured.

2. QUALITY - how close to the correct thickness

Every slab is measured at Jot. The score depends on how close it is to the **ideal thickness**.

Slab	Ideal at Jot	Measured (3 cm slab)	Quality score
3 cm	34 mm	34 mm - on target	100%
2 cm	24 mm	35 mm	75%
1.2 cm	16 mm	36 mm	50%
		37 mm	25%
		38 mm or more	0%
		32 mm	50%
		30 mm or less	0%

It works the same both ways - **too thick is as bad as too thin**. Too thick wastes material and takes longer to polish. Too thin cannot be corrected and the slab may be lost. Weight follows thickness, so a slab off-target on thickness is off-target on weight too.

Worked example

A shift makes **300 slabs** averaging **35 mm** on a 3 cm slab. Quality = 75%. **Score = $300 \times 0.75 = 225$ points.**
Another shift makes **260 slabs** at **34 mm**, exactly on target. Quality = 100%. **Score = $260 \times 1.00 = 260$ points.**

The second shift wins with fewer slabs, because every slab was right.

IMPORTANT - log in to your OWN shift only

The score is counted from the MIS entry. If you are logged in during another shift, your work is counted in THEIR score - not yours.

This is the most common way a shift loses points it had already earned.

- **Log in at the start of your shift.** No login = no entry = no score for that hour.
- **Enter every hour in MIS.** Missing hours are missing production. The system cannot count what was never entered.
- **LOG OUT at the end of your shift.** If you stay logged in, the next shift's slabs are recorded under your name - and your own next shift may show nothing.
- **Never enter data for another shift.** If an hour was missed, tell your incharge - do not fill it in under the wrong shift.
- **Enter the correct shift number (1 / 2 / 3)** on every record. Wrong shift = slabs go to the wrong team.

We check this. The system compares the shift written on each record against the actual clock time. Records logged under the wrong shift are visible in the report and will be corrected - which may move points from one shift to another.

What you must record for the score to count

The score can only count what is measured. **A slab with no thickness reading at Jot cannot earn quality points.**

- Enter the **thickness readings at Jot** for every slab - all measurement points.
- Enter the **slab class** (3 cm / 2 cm / 1.2 cm) on every Jot record.
- Enter every **MIS hour** with the correct **shift number** and the **incharge names**.

If a shift measures only a few slabs, its quality score is built from those few slabs only. **Measure everything - it is your own score.**

How the money is decided

1. At the end of the month every shift's score is totalled.
1. Shifts are **ranked** by score.
1. Each rank carries an incentive **percentage of salary**.
1. Everyone on that shift receives that percentage **of their own salary**.

Rank	Incentive
1st place	_____ % of salary
2nd place	_____ % of salary
3rd place	_____ % of salary

Conditions

- A shift must meet the **minimum quality standard** to take first place - the highest quantity alone does not win.
- **Safety comes first.** Any lost-time accident in the shift means no incentive that month, whatever the score.
- Scores are **published every month** and can be checked. If you believe a number is wrong, raise it with your incharge - every point traces back to the individual slab records behind it.

Make more. Make it right. Log in to your own shift. Record everything.
